Understanding ICND2 Certification and Exam Overview

Before diving into specific questions and answers, it's important to understand what the ICND2 exam entails.

What is the ICND2 Certification?

The ICND2 exam is part of the Cisco CCNA Routing and Switching certification track. Passing the ICND2 exam, in conjunction with ICND1, grants the CCNA Routing and Switching certification, validating your ability to install, configure, operate, and troubleshoot small to medium-sized enterprise networks.

ICND2 Exam Details

- Number of Questions: Approximately 45-55 questions
- Duration: 90 minutes
- Question Types: Multiple-choice, drag-and-drop, simulation, and testlet questions
- Passing Score: Varies, but typically around 80%

Key Topics Covered in ICND2 Questions and Answers

The ICND2 exam assesses knowledge across several core networking areas:

- Routing Protocols (EIGRP, OSPF, BGP)
- VLANs and Inter-VLAN Routing
- Wireless LANs (WLANs)
- Network Security and ACLs

- WAN Technologies
- Network Troubleshooting
- IPv4 and IPv6 Addressing and Subnetting

In the following sections, we will explore common questions and answers within these topics.

Sample ICND2 Questions and Answers

Routing Protocols

Q1: What is the primary difference between EIGRP and OSPF?

Answer: EIGRP (Enhanced Interior Gateway Routing Protocol) is a Cisco proprietary protocol that uses Diffusing Update Algorithm (DUAL) for rapid convergence and supports multiple network layer protocols. OSPF (Open Shortest Path First) is an open standard link-state routing protocol that uses Dijkstra's algorithm for shortest path calculation and is suitable for larger, hierarchical networks.

Q2: How does EIGRP achieve fast convergence?

Answer: EIGRP uses the DUAL algorithm to quickly recompute routes when a network change occurs, enabling rapid convergence. It also maintains a topology table and uses bounded updates, reducing the amount of routing information exchanged.

VLANs and Inter-VLAN Routing

Q3: What is the purpose of the 'router-on-a-stick' configuration?

Answer: 'Router-on-a-stick' enables inter-VLAN routing by configuring a single physical router interface with multiple sub-interfaces, each associated with a different VLAN. This allows devices in different VLANs to communicate through the router.

Q4: How do VLANs improve network security and performance?

Answer: VLANs segment a physical network into logical broadcast domains, reducing broadcast traffic and isolating sensitive data. This improves security by limiting access and enhances network performance by containing broadcast traffic within each VLAN.

Wireless LANs (WLANs)

Q5: What is the purpose of WPA2 in WLAN security?

Answer: WPA2 (Wi-Fi Protected Access 2) provides robust security for wireless networks by implementing AES encryption, ensuring confidentiality, integrity, and authentication for wireless communications.

Q6: How does SSID broadcasting affect WLAN security?

Answer: Broadcasting the SSID (Service Set Identifier) makes the wireless network visible to nearby devices, simplifying connection but potentially exposing the network to unauthorized access. Disabling SSID broadcast adds a layer of obscurity but should be combined with other security measures.

Network Security and ACLs

Q7: What is the primary purpose of Access Control Lists (ACLs)?

Answer: ACLs are used to filter network traffic based on defined rules, allowing or denying specific traffic types, enhancing security, and controlling access to network resources.

Q8: How do standard and extended ACLs differ?

Answer: Standard ACLs filter traffic based solely on source IP addresses, while extended ACLs can filter based on source and destination IP addresses, protocols, port numbers, and other parameters, providing more granular control.

WAN Technologies

Q9: What are the common characteristics of PPP (Point-to-Point Protocol)?

Answer: PPP is a data link layer protocol used over serial links, supporting multiple network layer protocols, providing authentication (PAP/CHAP), and enabling link configuration and maintenance.

Q10: How does MPLS (Multiprotocol Label Switching) improve network performance?

Answer: MPLS forwards packets based on labels rather than IP addresses, enabling faster routing, traffic engineering, and the creation of VPNs, which collectively improve network efficiency and scalability.

- Network Security: Access Control Lists (ACLs), device security, and secure management.
- Network Automation and Programmability: Basic understanding of network automation concepts (more relevant for higher-level exams).

Understanding these domains allows candidates to focus their study efforts effectively and anticipate the types of questions they will face.

Common ICND2 Questions and Expert-Reviewed Answers

The exam format includes multiple-choice questions, drag-and-drop activities, and simulations. Here, we focus on common multiple-choice questions, providing detailed explanations for each answer.

Question 1: What Is the Purpose of the Spanning Tree Protocol (STP)?

Options:

- A. To prevent loops in a switched network
- B. To provide redundancy in wireless networks
- C. To assign IP addresses dynamically
- D. To route packets between different networks

Answer: A. To prevent loops in a switched network

Explanation:

STP (originally IEEE 802.1D) is a fundamental protocol designed to prevent Layer 2 switching loops in Ethernet networks. Loops can cause broadcast storms, MAC table instability, and network outages. STP detects redundant paths and dynamically blocks some links to create a loop-free topology, while still allowing for redundancy if active links fail.

Key Points:

- STP elects a root bridge based on bridge priorities.
- It calculates the shortest path to the root bridge.
- Ports are placed into blocking or forwarding states to avoid loops.
- Variants like Rapid Spanning Tree Protocol (RSTP) improve convergence times.

Question 2: Which Routing Protocols Are Classless? (Select Two)

Options:

- A. RIPv1
- B. RIPv2
- C. OSPF
- D. EIGRP

Answer: B. RIPv2, C. OSPF, D. EIGRP

Explanation:

Classless routing protocols support Variable Length Subnet Masking (VLSM) and route summarization, allowing more efficient IP address utilization.

- RIPv1: Classful, does not send subnet mask information.
- RIPv2: Classless, includes subnet mask in updates.
- OSPF: Classless, supports VLSM.
- EIGRP: Classless, supports VLSM and route summarization.

Understanding the distinction between classful and classless protocols is crucial for designing scalable networks.

Question 3: Which Command Is Used to View the Routing Table on a Cisco Router?

Options:

- A. show ip route
- B. show running-config
- C. show interfaces
- D. show arp

Answer: A. show ip route

Explanation:

The `show ip route` command displays the current routing table, which includes directly connected routes, static routes, and dynamic routing protocol routes. This command is fundamental for troubleshooting and verifying routing configurations.

- `show running-config` displays device configuration.
- `show interfaces` shows interface status and statistics.
- `show arp` displays the ARP table.

Question 4: What Is the Function of NAT in a Network?

Options:

- A. To translate private IP addresses to public IP addresses
- B. To encrypt data between sites
- C. To assign IP addresses dynamically
- D. To route packets between different networks

Answer: A. To translate private IP addresses to public IP addresses

Explanation:

Network Address Translation (NAT) enables devices within a private network to communicate with external networks by translating private IP addresses to a public IP address. NAT conserves public IP addresses and adds a layer of security by hiding internal network structures.

Types of NAT:

- Static NAT: One-to-one mapping.
- Dynamic NAT: Dynamic assignment from a pool.
- PAT (Port Address Translation): Many-to-one mapping using port numbers.
