Thermodynamics answers Mrs. Laux

Understanding thermodynamics is essential for students studying physical sciences and engineering. Mrs. Laux's guidance has helped many learners grasp complex concepts through clear explanations and practical examples. In this comprehensive guide, we will explore common questions and solutions related to thermodynamics, focusing on Mrs. Laux's approach to teaching and providing detailed answers to typical problems students encounter. Whether you're preparing for exams or seeking to deepen your understanding, this article aims to serve as a valuable resource.

Introduction to Thermodynamics

Thermodynamics is the branch of physics that deals with the relationships between heat, work, temperature, and energy. It forms the foundation for understanding energy systems, engines, refrigerators, and more. Mrs. Laux emphasizes the importance of mastering fundamental principles before moving on to complex applications.

Basic Concepts in Thermodynamics

- System and Surroundings: The part of the universe under study versus everything outside it.
- Types of Systems: Open, closed, and isolated systems.
- State Functions: Properties like pressure, temperature, volume, and internal energy that depend only on the current state, not how it was achieved.
- Processes: How systems change states? adiabatic, isothermal, isobaric, and isochoric.

Common Thermodynamics Questions and Mrs. Laux's Detailed Answers

This section covers typical questions students ask, with step-by-step solutions and explanations aligned with Mrs. Laux's teaching methodology.

1. How to Calculate the Work Done in an Isothermal Process?

In an isothermal process, temperature remains constant. For an ideal gas, the work done during

such a process can be calculated using the formula:

\[

$$W = nRT \ln \frac{V_f}{V_i}$$

\]

Where:

- (W) = work done
- (n) = number of moles of gas
- (R) = universal gas constant
- (T) = absolute temperature
- (V_f) = final volume
- (V_i) = initial volume

Step-by-step solution:

- Identify known variables:
- Determine initial and final volumes.
- Confirm temperature remains constant.
- Calculate work:
- Plug values into the formula.
- Compute the natural logarithm of the volume ratio.
- Interpret the result:
- Positive work indicates work done by the system.
- Negative work indicates work done on the system.

Example:

A gas expands from 10 L to 20 L at 300 K. How much work is done?

Solution:

\[

$$W = (1 \text{ mol})(8.314 \text{ J/mol}\cdot\text{K})(300 \text{ K}) \ln \frac{20}{10} = 8.314 \times 300 \times \ln 2 \approx 8.314 \times 300 \times 0.693 \approx 1727 \text{ J}$$

\]

Thus, approximately 1727 Joules of work are done by the gas during expansion.

2. What is the First Law of Thermodynamics and How is it Applied?

Answer:

The First Law of Thermodynamics states:

\[

$$\Delta U = Q - W$$

\]

Where:

- ΔU = change in internal energy of the system
- Q = heat added to the system
- W = work done by the system

Application:

- In an isothermal process: $\Delta U = 0$, so $Q = W$.
- In an adiabatic process: $Q = 0$, so $\Delta U = -W$.
- In a constant volume process: no work is done ($W=0$), so the heat added equals the change in internal energy.

Example:

A gas absorbs 500 J of heat and performs 200 J of work. Find the change in internal energy.

Solution:

\[

$$\Delta U = Q - W = 500 \text{ J} - 200 \text{ J} = 300 \text{ J}$$

\]

The internal energy increases by 300 Joules.

3. How to Determine the Efficiency of a Heat Engine?

Answer:

The efficiency (η) of a heat engine is given by:

\[

$$\eta = \frac{W_{\text{out}}}{Q_{\text{in}}} \times 100\%$$

\]

or, for idealized engines like Carnot:

\[

$$\eta_{\text{max}} = 1 - \frac{T_{\text{cold}}}{T_{\text{hot}}}$$

\]

Where:

- (W_{out}) = work output
- (Q_{in}) = heat supplied to the engine
- (T_{hot}) and (T_{cold}) = absolute temperatures of hot and cold reservoirs

Step-by-step:

- Identify heat input and work output.
- Calculate efficiency using the formula.
- For ideal engines, use temperature-based efficiency for maximum theoretical efficiency.

Example:

A heat engine absorbs 1000 J of heat from a hot reservoir at 600 K and produces 300 J of work. What is its efficiency?

Solution:

\[

$$\eta = \frac{300 \text{ J}}{1000 \text{ J}} \times 100\% = 30\%$$

\]

Maximum efficiency (Carnot):

\[

$$\eta_{\text{max}} = 1 - \frac{T_{\text{cold}}}{T_{\text{hot}}}$$

\]

If cold reservoir is at 300 K:

\[

$$\eta_{\text{max}} = 1 - \frac{300}{600} = 0.5 = 50\%$$

\]

The real engine's efficiency is below the maximum theoretical efficiency.
