Working Principle of the MikroC Line Follower Robot

Sensor Detection

Infrared sensors emit IR light and detect reflected IR light from the surface. When over a dark line, the reflectance changes, enabling sensors to determine whether they are on or off the line.

Decision Making

Based on sensor readings:

- If both sensors detect the line, move forward.
- If only the left sensor detects the line, turn left.
- If only the right sensor detects the line, turn right.
- If no sensors detect the line, the robot may stop or perform a search pattern.

Motor Control

The microcontroller processes sensor inputs and controls motor driver inputs to steer the robot accordingly:

- Forward movement

- Turning left or right
- Stop or reverse if necessary

Feedback Loop

The robot continuously repeats this detection and actuation process, enabling it to follow the designated line accurately.

Sensor Placement

- Position IR sensors close to the ground
- Proper alignment for accurate detection
- Use multiple sensors for better accuracy

Motor Control

- Implement PWM for speed regulation
- Use appropriate motor driver for current capacity
- Consider acceleration and deceleration for smooth movement

Power Management

- Use batteries with sufficient capacity
- Add voltage regulation for microcontroller stability
- Protect circuits with fuses or overcurrent protection

Algorithm Enhancements

- Implement proportional control for smoother following
- Use sensors array for wider detection
