Key Vocabulary Terms in the Minerals Chapter

The assessment review typically covers a core set of vocabulary words that form the foundation of mineral knowledge. Here, we analyze some of these critical terms in detail.

Mineral

Definition: A naturally occurring inorganic solid with a definite chemical composition and an ordered internal structure (crystal lattice).

Significance: Recognizing what constitutes a mineral is fundamental. It distinguishes minerals from rocks, organic materials, or man-made substances. The definition emphasizes natural origin, inorganic nature, and crystalline structure, which are essential criteria for mineral identification.

Crystal

Definition: The solid geometric form of a mineral with flat faces and specific angles, resulting from the orderly arrangement of atoms.

Significance: Crystals demonstrate the internal atomic arrangement of minerals and influence their

external shape. Understanding crystal forms helps in identifying minerals and understanding their formation processes.

Luster

Definition: The way a mineral's surface reflects light.

Types:

- Metallic
- Non-metallic (glassy, pearly, silky, earthy)

Importance: Luster provides clues about mineral composition and structure. For example, metallic luster indicates the presence of metals, while non-metallic luster suggests non-metallic elements.

Hardness

Definition: The resistance of a mineral to being scratched, measured on the Mohs scale (1-10).

Relevance: Hardness assists in mineral identification. Talc (1) is the softest, while diamond (10) is the hardest. Testing hardness helps differentiate minerals with similar appearances.

Color and Streak

- Color: The visible hue of a mineral.
- Streak: The color of a mineral's powder when rubbed on a porcelain plate.
